

New Activeworx 5.0 Brings Advanced Security Information and Log Management Functionality to Managed Service Providers, SMB and the Enterprise.

CrossTec Corporation releases v5 of its SIEM and log management line enhancing functionality and speeding up reporting and query assimilation.

BOCA RATON, FL--(July 14, 2008) - CrossTec Corporation announced today the summer release of version 5.0 of its Activeworx family of security information and log management products.

The Activeworx line now includes Activeworx Enterprise, a unified and fully integrated SIEM/log management solution; Activeworx Security Center, with enterprise-grade SIEM capabilities; and new to the product line: Activeworx Event Manager (AEM), an initial entry Security Event Management solution with add-on logging capabilities for Small-Medium Businesses. AEM's low price point and logging functionality make it the only product of its kind for SMB.

"We are very excited to offer Activeworx 5.0 in the marketplace. When we introduced Activeworx 4.5 the market responded to our enhancements with tremendous success and a wealth of new implementations from the first week the product was launched. Activeworx 5.0 builds on that market share, and incorporates many new features which drastically enhance the usability, searching, and reporting options for historical data. The complete Activeworx version 5.0 product offers our customers the most powerful SIEM and log management product available today," said Jeff Richards, VP of sales for Activeworx.

New logging features offered in the Activeworx Enterprise include: data separation, used to generate unique data stores; detailed, enhanced reporting; scheduled reporting, including the ability to schedule reports on historical logged data; query histories which users can now perform and recall at a moment's notice; host group queries, and advanced query processing which processes databases on a set of customized rules and then displays them in various reporting formats. Activeworx Security Center has additional upgrades as well, including: desktop notification systems for the generation of alerts; ticketing system technology for advanced ticketing and features throughout the product for the resolution of security incidents; and a real-time event viewer which is used to view events as they are happening and being collected.

The launch of Activeworx 5.0 enables users to collect their information quicker, view it faster, and assimilate it into reporting windows and formats which are fully customizable and user-friendly. This release truly completes the Activeworx family of SIEM and log management solutions and brings the marriage of security and logging technologies further than they have ever gone before.

About CrossTec Corporation:

Since 1999, CrossTec's Activeworx brand security tools (www.crosstecsecurity.com) have been downloaded more than 100,000 times. The flagship product, Activeworx Enterprise v5.0, is an enterprise level, high performance, and cost-effective security information and event management (SIEM) and log management solution that provides real-time security device log monitoring with correlated alerts, management and compliance reports, tools for advanced, in-depth forensic analysis and long term data retention. CrossTec's mission is to protect organizations by reducing the time it takes to analyze massive amounts of event log data from multiple devices and vendors to produce real-time alerts and vital reports that pinpoint network security breaches as well as providing companies the data retention capabilities required to be compliant.
